

BLUE RIVER ANALYTICS: ACQUISITION TEMPLATE

The Acquisition application template from Blue River Analytics uses your vendor data subscriptions such as IHS and DrillingInfo to help you quickly answer questions regarding an acquisition. Some of these questions include:

- Where does the operator drill and what assets do they have?
- What was their IP values?
- What does their well count look like over time?
- Have they drilled wells that haven't yet been completed?
- What does the production by 1000 ft. lateral over time look like?
- How does the assets production compare to the production of nearby wells?

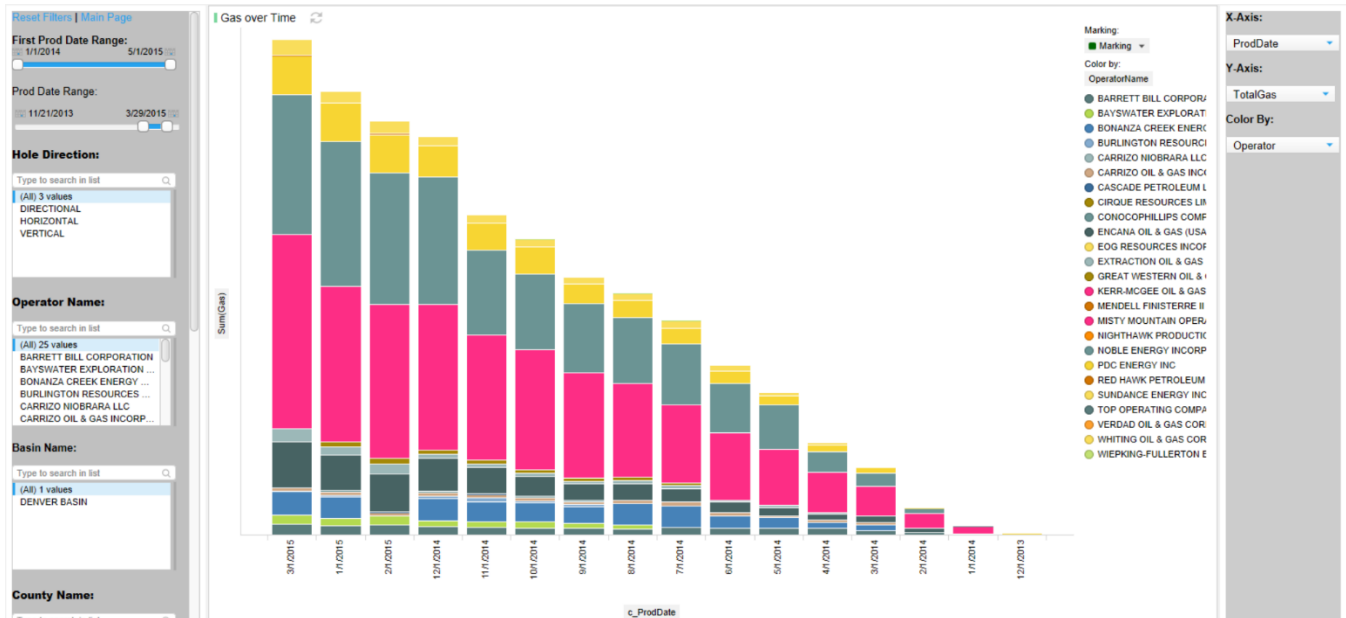

There are two main subjects that the templates cover. The first is allowing the user to pick an asset they are interested in acquiring and then analyze the asset and gather valuable answers. The second is allowing the user to pick an operator they are interested in and then being able to compare that operator to all other operators within the chosen asset. The visualizations will quickly show how the production values differ between the operator of interest and the rest of the asset. They will also show completion and treatment variable comparisons.

The template incorporates user controls, familiar visualizations like cumulative and time-normalized plots, and Spotfire's native ease-of-use allows users of any ability to perform complex analysis.

After a few minutes, using the visualizations in the template you could make a quick decision on whether this asset is worth continuing to analyze.
